

Figure 6:10 Early growth of cucumber (*Cucumis sativus*) (a) and wong bok (*Brassica pekinensis*) (b) is greatly enhanced in elevated  $\text{CO}_2$  (1250 ppm) compared with ambient controls (325 ppm). As shown here, that initial effect is still apparent after 52 d of greenhouse culture in nutrient-rich potting mix. Scale bar = 10 cm. (Further details in Kriedemann and Wong (1984) and Table 6.4)
